Experiment 2

Flight Reservation

Aim

To create a Flight Reservation application on the Zoho One cloud platform using Zoho Creator, and to demonstrate how a Software as a Service (SaaS) application lets users enter and view flight bookings through a web browser, with all data stored in the cloud.

Procedure

1. Sign in to the Zoho One cloud portal with a valid account.
2. From the list of Zoho One applications, open **Zoho Creator**.
3. Click **Create Application** and create a new application for flight reservation.
4. Add a new form named **Flight**.
5. Add the following fields to the form:
    - Passenger Name (Name field – first and last name)
    - Destination (Single Line text)
    - Flight Number (Number field)
    - Departure Time (Time field, HH:mm:ss)
    - Arrival Time (Time field, HH:mm:ss)
6. Choose the correct field type for each field so that the data is stored in the right format.
7. Arrange the fields neatly and keep the **Submit** button at the bottom of the form.
8. Save the form and open the application in the live (published) view.
9. Enter sample flight details in the **Flight** form and click **Submit**.
10. Open the **All Flights** report and check that the submitted record is stored in the cloud.
11. Open the record to view its full details, and repeat with different values to test the application.

Implementation

Input:

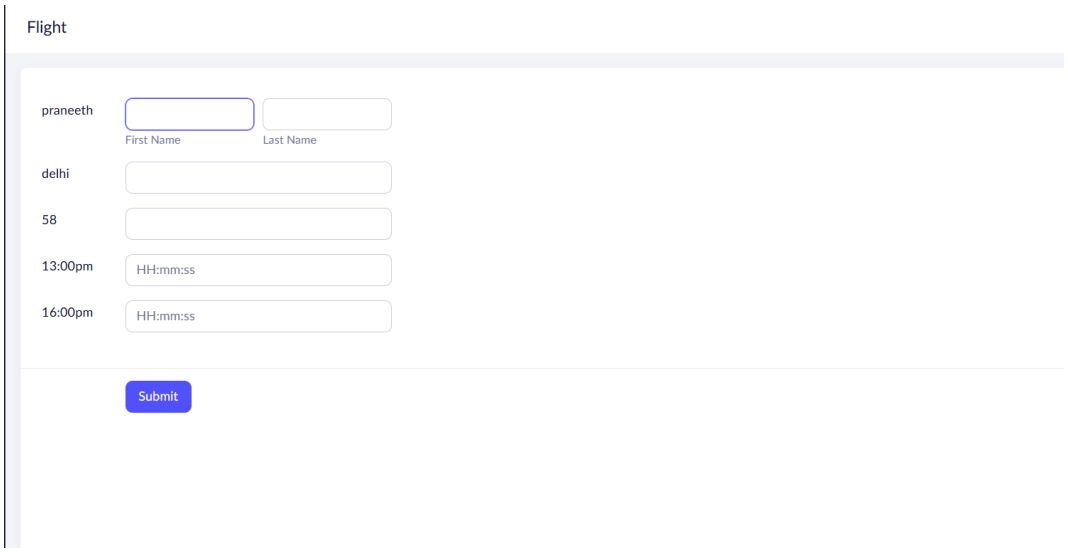

Fig. 1: Flight reservation form

Output:

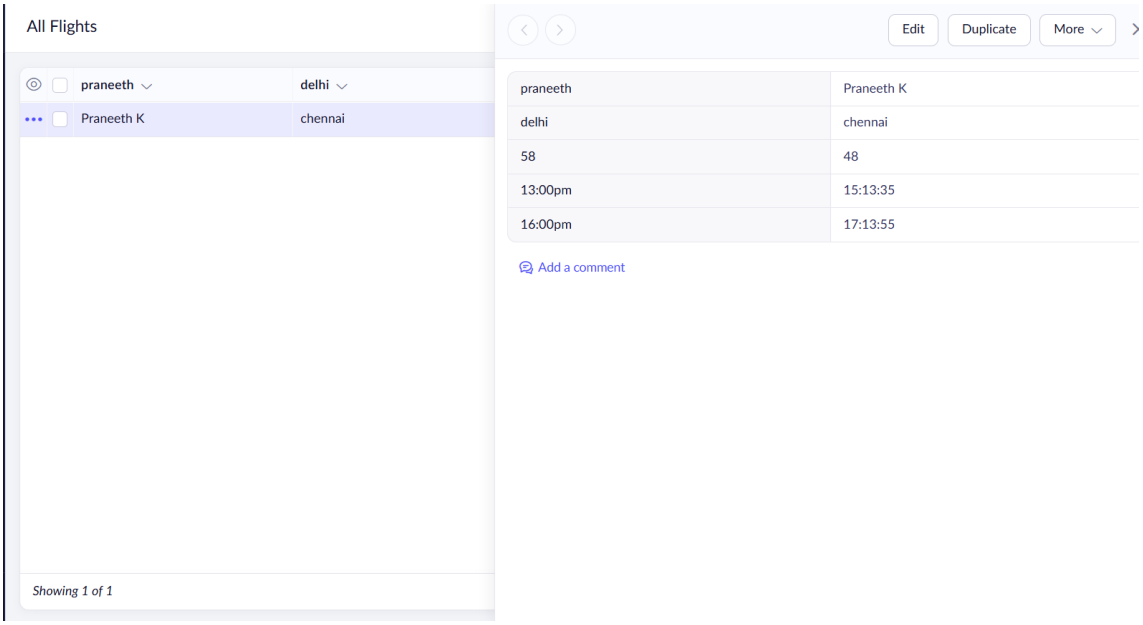

Fig. 2: All Flights report showing the stored record and its details

Result

Thus, a Flight Reservation application was successfully created using Zoho Creator in Zoho One. The submitted flight details were saved in the cloud and displayed in the All Flights report, which shows that the application works as a Software as a Service (SaaS) solution.
